

1. Steel Posts for the Steinberger R-Trem

These steel posts, proved and tested on a large number of Steinberger KB Tremos worldwide, are now available for the Steinberger R-Trem too. Although this trem doesn't have the "bent posts syndrome" to the same degree as the KB Trem, bent posts can and do happen from time to time.

Especially for use with heavier gauge strings (which leads to stronger forces on the posts) these steel posts are highly recommended. These steel posts better withstand the forces, due to a better material and the additional supporting "foot".

Use padded pliers for screwing the new steel posts in, in order to avoid scratches. **Don't try to screw them in by hand, since the "feet" on the steel posts might have sharp edges.**

You might also want to add some glue or thread locking compound when screwing the new posts in, in order to prevent them from getting loose during usage.
